Summary

The Biodiversity Building Blocks for Policy (B3) project aims to enhance the impact and broaden the use of biodiversity information to inform policy making through the provision of clear, informative and reproducible biodiversity analyses. A key aspect of B3 is its commitment to the FAIR principles—Findable, Accessible, Interoperable and Reproducible—which serve as the cornerstone for interoperability. To achieve this goal, we developed a prototype for data mobilisation from the Global Biodiversity Information Facility (GBIF) to the EBV data portal, increasing the interoperability of occurrence cubes under FAIR principles. Both data portals provide a Digital Object Identifier (DOI) that ensures the location and citation of data. Additionally, the EBV Data Cube adheres to the metadata standard of the Climate and Forecast convention and is based on the NetCDF format.

In this milestone, we have worked with two species lists from EU legislation: the Birds Directive (Annex I) and the Invasive Alien Species (IAS) of Union concern. Our aim was to demonstrate data mobilisation between GBIF and the EBV Data Portal. For each legislation we cross-checked the taxonomy and created an occurrence cube through the GBIF API. We also conducted an initial data exploration at different taxonomic levels and over time. Finally, we calculated basic spatial metrics per species, such as the total number of occurrences, the earliest month and the latest month with occurrences in all years, among others. The results were published as spatial metrics in the form of EBV Cubes. To ensure open access to our code, we used GitHub, and prepared notebooks in Rmarkdown, which are available in HTML and PDF formats for easy reproducibility.

In summary, we successfully mobilised data of importance to the EU while providing accessibility to inputs and outputs via open data portals and DOIs. Additionally, all code for data analysis is open and documented, with notebooks published. We strongly believe that our results will foster data mobilisation beyond the B3 project and increase interoperability between biodiversity data formats.

List of abbreviations

B3	Biodiversity Building Blocks for Policy
DOI	Digital Object Identifier
EBV	Essential Biodiversity Variable
EEA	European Environment Agency
ETC BE	European Topic Centre on Biodiversity and Ecosystems
EU	European Union
FAIR	Findable, Accessible, Interoperable and Reproducible
IAS	Invasive Alien Species
GBIF	Global Biodiversity Information Facility
GEOBON	Group of Earth Observation Biodiversity Observation Network

1 Introduction

During the first year of the project, B3 and GBIF successfully launched the first implementation for the generation of occurrence cubes through the GBIF API. The specifications for the occurrence cube allow users to define the desired species, taxonomic levels, data span, spatial uncertainty, source of record, grid type, and other parameters. The resulting occurrence cube is provided in a CSV format that aggregates the species occurrence within each encoded grid cell, with the additional specifications included in adjacent columns. Each occurrence cube is assigned a DOI and can be downloaded from the GBIF website.

Meanwhile, the EBV Data Portal from GEO BON has, in recent years, developed an infrastructure to create¹ and publish² the spatial results of biodiversity data analysis. The output of the [ebvcube R package](https://github.com/LuiseQuoss/ebvcube) is a multidimensional array in NetCDF format. Importantly, it incorporates metadata following the Climate and Forecast metadata standard, which facilitates interoperability with other data sets.

In this milestone, we aim to explore the data mobilization workflow between GBIF occurrence cubes and the EBV Data Portal (Figure 1) to subsequently improve the platform's interoperability. We intend to examine the diversity of the systems, tools, and data cube formats while demonstrating the power of the cubes for data analysis. Ultimately, this will facilitate biodiversity assessments for research and policy-making.

Figure 1: Schema of the main stages of data mobilisation using GBIF occurrence cube and ending at the EBV Data Portal.

2 Increasing interoperability between GBIF Occurrence Cubes and the EBV Data Portal

This section documents the data mobilisation for two of the most important EU biodiversity legislations related to nature: The Birds Directive (Annex I) and the IAS of Union concern. The subsequent sections include an overview of the workflow. Section 2.1 and 2.2 begin with a table with freely accessible links to the corresponding inputs, outputs and code. This is followed by a brief description of the different datasets and methods and some examples of the results.

2.1 From occurrence cubes to EBV cube metrics for the Birds Directive Annex I Species: A 10 km prototype in EU27

This workflow focused on GBIF occurrences of 193 species listed in Annex I of the Birds Directive and subject to special conservation measures. Table 1 includes the web portals and repositories used in our workflow accompanied by the DOIs and links to access the input and output data, as well as the scripts.

Table 1: Open access details of the inputs, outputs and code used in the mobilisation of data and metrics for Annex I of the Birds Directive.

  EBV Data Portal	10.25829/mbw554	Metrics: <ul style="list-style-type: none"> • Total number of occurrences • Earliest month with occurrences across all years • Latest month with occurrences across all years • Month with the highest total number of occurrences across all years • Month with the second-highest total number of occurrences across all years • Month with the third-highest total number of occurrences across all years
  GitHub repository and Zenodo DOI	https://github.com/EBVcube/B-Cubed_data_mobilisation DOI: 10.5281/zenodo.13798783	Notebooks for all data mobilisation steps in R (see section 2.3)

2.1.1 EBV Cube Overview

The scientific names listed in the Annex I of the Birds Directive were cross-referenced with the GBIF backbone taxonomy. Using the GBIF accepted names and the EEA spatial grid at a 10 km resolution, we generated the occurrence cube via the GBIF API in R (DOI: 10.15468/dl.43ydtq). A total of 168 species met the criteria for inclusion in the cube.

The following preliminary occurrence metrics were calculated for each grid cell in the cube:

- Total number of occurrences
- Earliest month with occurrences across all years
- Latest month with occurrences across all years
- Month with the highest total number of occurrences across all years
- Month with the second-highest total number of occurrences across all years
- Month with the third-highest total number of occurrences across all years

2.1.2 Methods

These are the general steps to calculate the metrics of species listed in the Annex I of the Birds Directive:

1. The scientific name of species in the Annex I was matched against the GBIF backbone taxonomy to obtain the accepted scientific name in GBIF and the corresponding acceptedSpeciesKey.
2. A JSON query was prepared for the corresponding species. The acceptedSpeciesKey was used as speciesKey for all records available until 2024 and with a coordinate uncertainty of 10000 m. The complete query specifications are available at <https://doi.org/10.15468/dl.43ydtq>.
3. Using the species occurrence [cube software](#) developed by B3 and GBIF³, we created species occurrence cubes in a CSV format matching the EEA grid at 10 Km.
4. We loaded the CSV occurrence cubes using the b3gbi library in R, and calculated the following metrics:
 - Total number of occurrences
 - Earliest month with occurrences across all years
 - Latest month with occurrences across all years
 - Month with the highest total number of occurrences across all years
 - Month with the second-highest total number of occurrences across all years
 - Month with the third-highest total number of occurrences across all years
5. After rasterization of the metrics, data was converted to the EBVCube format using the [ebvcube package](#)⁴ in R.

All scripts used R language and are available at [GitHub](#)⁵.

2.1.3 Notebooks

Notebooks were designed to illustrate all steps of data mobilisation. They include the pre-processing phase, occurrence cube generation, data exploration, metrics calculation and EBV cube creation. The notebooks were written in Rmarkdown and available on GitHub as Rmd, HTML and PDF (Table 2).

Table 2. Data Mobilisation Notebooks from GBIF to the EBV Data Portal for the Birds Directive Annex I.

* Preprocessing notebook

Figure 3 shows some examples of the data exploration and metrics computation notebooks. Figure 3a shows the increasing amount of data for all species in the list, while Figure 3b shows only for the five species with the highest number of records. In addition, Figures 3c and 3d show two metrics for *Circus pygargus* (Montagu's Harrier). The first metric is the total number of occurrences over time and the second is the earliest month of GBIF records in all years.

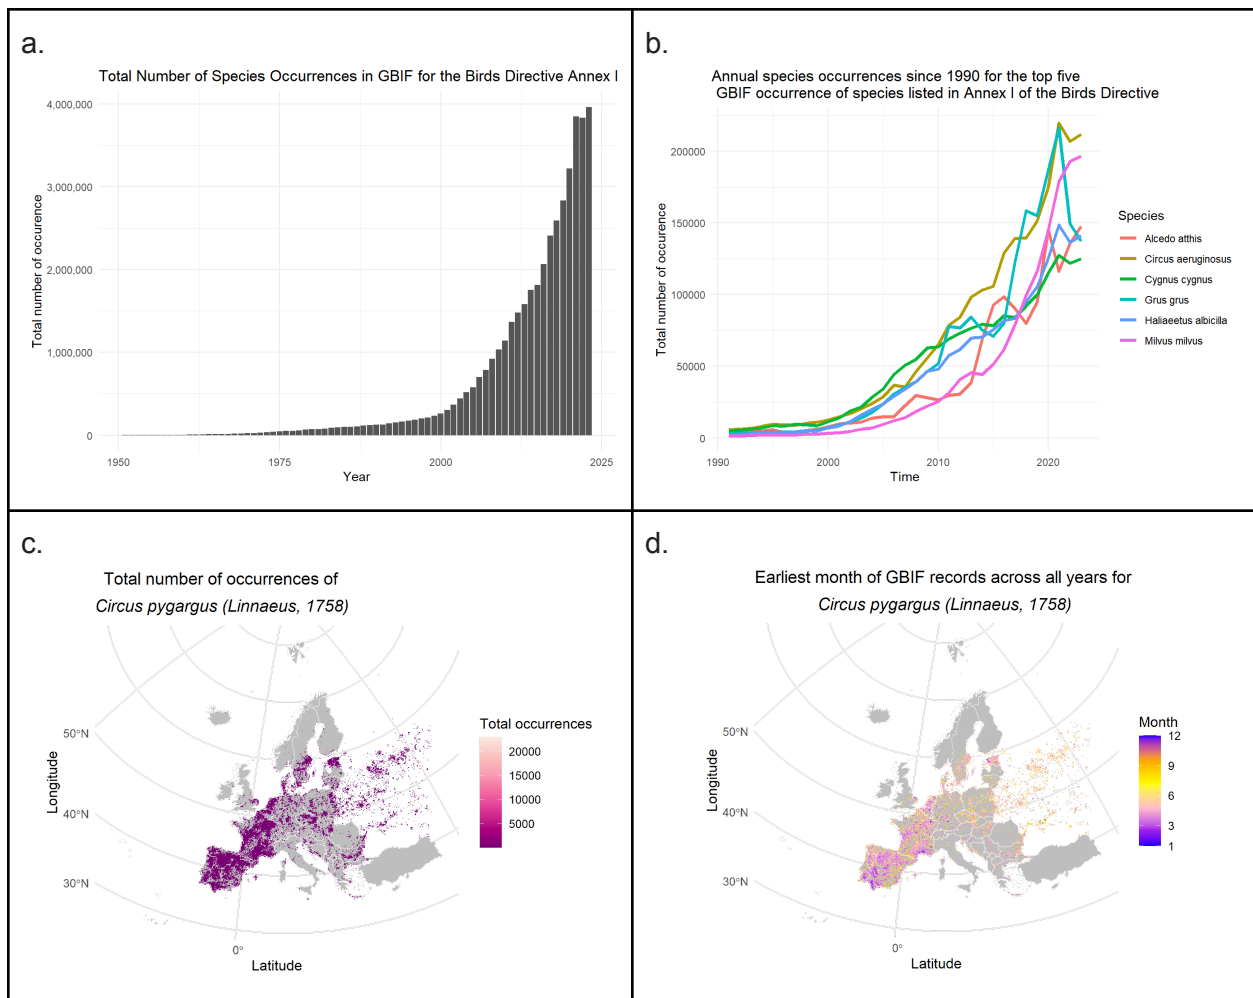

Figure 3. Examples of figures from the data exploration and metrics computation of the Birds Directive Annex I. a. Annual number of occurrences over time since 1900 for all species and b. Annual occurrence for species with the highest occurrence since 1990 (Notebook 2). Metrics of (c.) the total number of occurrences of *Circus pygargus* (waterweed) per pixel and (d.) the earliest month of records across all years for the same species (Notebook 3).

2.2 From occurrence cubes to EBV cube metrics for Invasive Alien Species of Union Concern: A 10 km prototype in EU27

This data workflow focused on GBIF occurrences of species listed under Regulation (EU) 1143/2014 on invasive alien species (IAS). Table 3 summarises the data portals and repositories used for the data mobilisation, and it also includes the DOIs and links to access the input and output data, as well as the code.

Table 3: Open access details of the inputs, outputs and code used in the mobilisation of data and metrics for the Invasive Alien Species of Union Concern.

  GitHub repository and Zenodo DOI	https://github.com/EBVcube/B-Cubed_data_mobilisation DOI: 10.5281/zenodo.13798783	Notebooks for all data mobilisation steps in R (see section 2.3)

2.2.1 EBV Cube Overview

The IAS list, adopted in 2016 and updated in 2017, 2019, and 2022, currently includes 88 species subject to strict environmental restrictions. For this study, we used the most recent IAS list from the European Topic Centre on Biodiversity and Ecosystems (ETC BE) and the European Environment Agency (EEA) as of June 2024. We matched these species' scientific names with the GBIF backbone taxonomy to obtain the accepted GBIF names and species keys.

Using the GBIF API in R, we generated CSV cubes of species occurrences, applying the EEA spatial grid at a 10 km resolution. Monthly occurrence data were collected for 77 species, and the following metrics were calculated for each grid cell in the cube:

- Total number of occurrences
- Earliest date of occurrences
- Latest date of occurrences
- Basis of record for the earliest date of occurrences
- Basis of record for the latest date of occurrences

2.2.2 Methods

These are the general steps to calculate the metrics of IAS of union concern based on GBIF records:

1. The field Currently valid full name from the latest IAS list by ETC in June 2024 was matched against the GBIF backbone taxonomy using the [Species matching tool](#)⁶. Thus, we obtained the accepted scientific name in GBIF and the corresponding species key. All names had an EXACT match, but four of them were considered SYNONYMS. We replaced all four SYNONYMS with the corresponding ACCEPTED scientific name and species key.
2. Using the Species occurrence cubes software developed by B3 and GBIF⁷, we created species occurrence cubes in a CSV format matching the EEA grid at 10 Km for records available from 1900 until mid June 2024. The query is in a JSON file and available at GitHub as well as the R script to submit the JSON query using GBIF API. Importantly only records for 77 species were found.
3. We loaded the CSV occurrence cubes using the b3gbi library, and calculated the following metrics: total number of occurrences, earliest date of records, latest date of records, basis of record of the earliest date, and basis of records of the latest date.
4. After rasterization of the metrics, data was converted to the EBVCube format.

Steps 2 to 5 were conducted in R. All scripts are available on [GitHub](#).

2.2.3 Notebooks

These notebooks were designed to illustrate all steps of the data mobilisation. They were written in Rmarkdown and are available as HTML and PDF in GitHub as well as the original code (Rmd).

The notebooks are listed in Table 4.

Table 4. Data Mobilisation Notebooks from GBIF to the EBV Data Portal for IAS of Union Concern.

* Preprocessing notebook

Some examples of data exploration and calculation of metrics are shown in Figure 4. Thus, we observe the annual number of occurrences of all species since 1900 (Figure 4a), as well as the occurrences of the five species with the highest number of records since 1990 (Figure 4b). Furthermore, two spatial metrics of *Elodea nuttallii* (waterweed) are shown. Figure 4c shows the total number of occurrences per pixel, while Figure 4 corresponds to the earliest date of records.

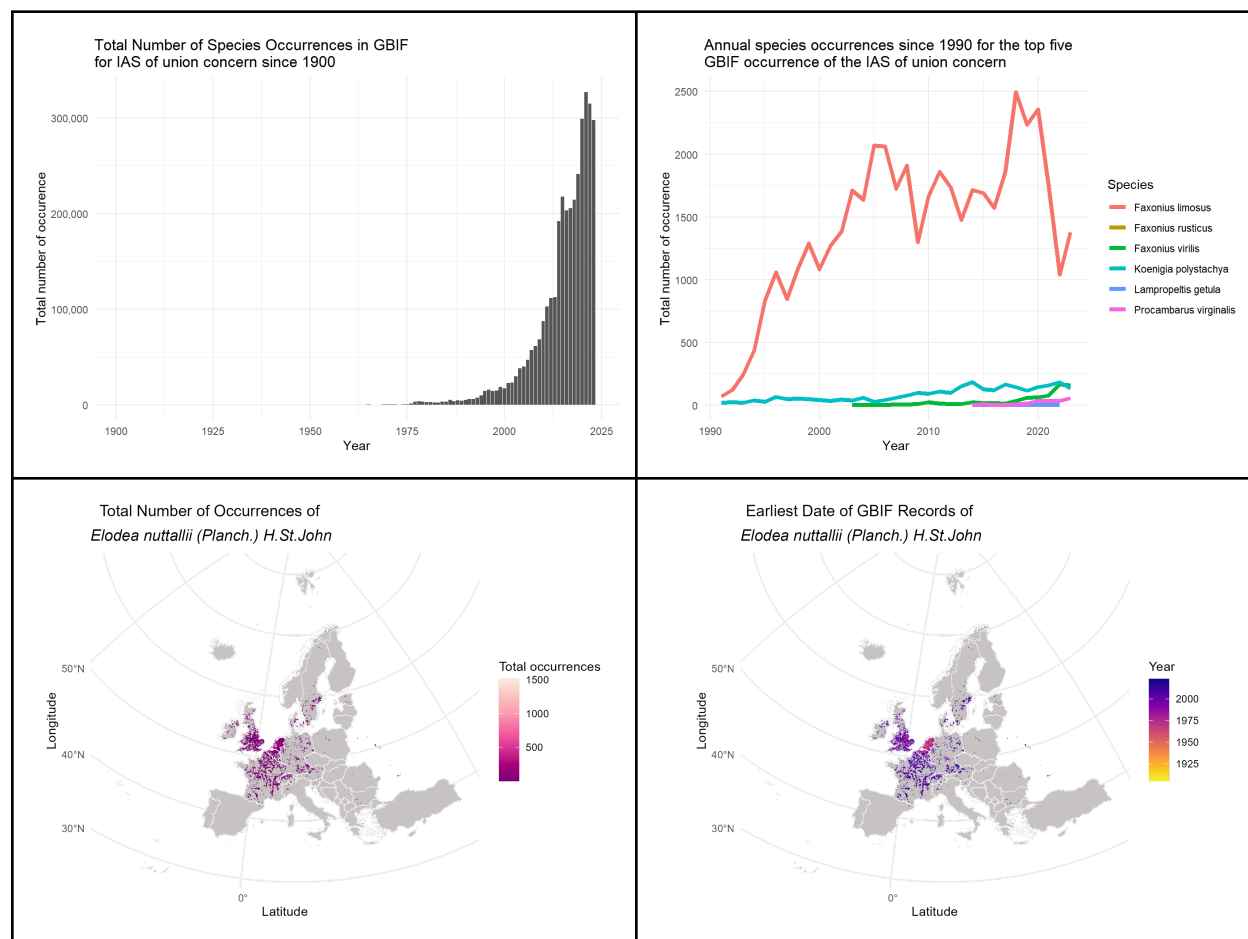

Figure 3. Examples of figures from the data exploration and metrics computation of the IAS of union concern. Upper row: Total number of occurrences over time (Notebook 2) . Bottom row: Metrics for *Elodea nuttallii* (waterweed)(Notebooks 3 and 4).

3 Acknowledgements

Special thanks to Emmanuel Oceguera and Luise Quoss for their support in defining the metric specifications and publishing the datasets. We thank Adriana Dechia and PENSOFT for editorial comments on the first notebooks draft, and Matthew Blissett and GBIF Helpdesk staff for assistance creating the JSON queries.

Specifically, here we use the European Environment Agency (EEA) grid in vector format at 10 km as spatial reference. The subsequent notebooks focus on the generation of species cubes, the calculation of metrics, and the conversion of the results into the EBV cube format for final upload to the EBV data portal.</p> <p><small>Note: This series of notebooks is part of the results of Task 3.3 of the Biodiversity Building Blocks for Policy project funded by the European Union's Horizon Europe Research and Innovation Programme (ID No 101059592). Additional notebooks exploring the results and calculating simple metrics are also available in the same repository.</small></p> </td> <td data-bbox="815 646 1425 955" style="width: 50%;"> <p>Data mobilisation from GBIF to the EBV Data Portal Code ▾</p> <p>   Funded by the European Union</p> <p>Pre-processing notebook - Harmonisation of species keys for the JSON query of species listed in the Annex I of the Birds Directive</p> <p>Lina Estupinan-Suarez, Miguel Fernandez German Centre for Integrative Biodiversity Research (iDiv) lina.estupinans@idiv.de</p> <p>2024-08-23</p> <p>Introduction</p> <p>In this notebook we prepare the <code>speciesusagekey</code> for birds listed in Annex I of the Birds Directive. Subsequently, we will work with the GBIF occurrence data and therefore use the <code>speciesusagekey</code> in its backbone taxonomy. We have previously prepared a list from Annex I of the Birds Directive that includes the taxonomy <code>proc</code>.</p> <p><small>Note: This series of notebooks is part of the results of Task 3.3 of the Biodiversity Building Blocks for Policy project funded by the European Union's Horizon Europe Research and Innovation Programme (ID No 101059592).
